## 1 PROBLEM

(hoffman/page84/11) :

Let  $\mathbb{V}$  be a finite-dimensional vector space and let  $\mathbf{T}$  be a linear operator on  $\mathbb{V}$ . Suppose that  $\text{rank}(\mathbf{T}^2) = \text{rank}(\mathbf{T})$ . Prove that the range and null space of  $\mathbf{T}$  are disjoint, i.e., have only the zero vector in common.

## 2 SOLUTION

Given	$\mathbb{V}$ is a finite-dimensional vector space, $\mathbf{T} : \mathbb{V} \rightarrow \mathbb{V}$ and $\text{rank}(\mathbf{T}^2) = \text{rank}(\mathbf{T})$
To Prove	range and null space of $\mathbf{T}$ are disjoint
Defining $\text{rank}(\mathbf{T})$	<p>Let <math>\{\beta_1, \dots, \beta_k, \beta_{k+1}, \dots, \beta_n\}</math> is the span of <math>\mathbb{V}</math>.</p> <p>The linear transformation of <math>\mathbb{V}</math> is <math>\{\mathbf{T}\beta_1, \dots, \mathbf{T}\beta_k, \mathbf{T}\beta_{k+1}, \dots, \mathbf{T}\beta_n\}</math>.</p> <p>Suppose the <math>\text{rank}(\mathbf{T}) = k</math>, then the basis of <math>\mathbf{T}</math> is <math>\{\mathbf{T}\beta_1, \dots, \mathbf{T}\beta_k\}</math> and are linearly independent.</p>
Defining $\text{range}(\mathbf{T}^2)$	<p>Now <math>\mathbf{T}^2 : \mathbb{V} \rightarrow \mathbb{V}</math> be a linear transformation for any <math>\alpha \in \mathbb{V}</math>.  <math>\therefore \mathbf{T}^2(\mathbb{V}) = \mathbf{T}(\mathbf{T}(\alpha))</math> and  <math>\{\mathbf{T}^2\beta_1, \dots, \mathbf{T}^2\beta_k\}</math> span the range of <math>\mathbf{T}^2</math></p> <p>since <math>\text{rank}(\mathbf{T}^2) = \text{rank}(\mathbf{T})</math>  <math>\implies \dim \text{range}(\mathbf{T}^2) = \dim \text{range}(\mathbf{T})</math>  <math>\therefore \{\mathbf{T}^2\beta_1, \dots, \mathbf{T}^2\beta_k\}</math> must be basis for <math>\text{range}(\mathbf{T}^2)</math></p>

<p>Obtaining <i>range</i> and <i>nullspace</i> of <math>\mathbf{T}</math></p>	<p>Now let <math>\alpha \in \text{range}(\mathbf{T})</math>, then it can be written as linear combinations of vectors in <math>\text{range}(\mathbf{T})</math>  <math>\therefore \alpha = C_1 \mathbf{T}\beta_1 + C_2 \mathbf{T}\beta_2 + \dots + C_k \mathbf{T}\beta_k</math></p> <p>If <math>\alpha \in \text{nullspace}(\mathbf{T})</math> also, then  <math>\mathbf{T}(\mathbb{V}) = 0</math>  <math>\implies \mathbf{T}(C_1 \mathbf{T}\beta_1 + C_2 \mathbf{T}\beta_2 + \dots + C_k \mathbf{T}\beta_k) = 0</math>  <math>\implies C_1 \mathbf{T}^2\beta_1 + C_2 \mathbf{T}^2\beta_2 + \dots + C_k \mathbf{T}^2\beta_k = 0</math></p> <p>since <math>\{\mathbf{T}^2\beta_1, \dots, \mathbf{T}^2\beta_k\}</math> is basis of <math>\mathbf{T}^2</math>  <math>\implies C_1 = C_2 = \dots = C_k = 0</math>  <math>\implies \mathbb{V} = 0</math>  <math>\therefore</math> if <math>\alpha</math> is in both <math>\text{range}(\mathbf{T})</math> and <math>\text{nullspace}(\mathbf{T})</math>, then <math>\alpha</math> must be a zero vector.</p> <p>Hence it is proved that range and null space of <math>\mathbf{T}</math> are disjoint.</p>
<p>Conclusion</p>	<p>The range and null space of <math>\mathbf{T}</math> are disjoint.</p>

TABLE 1: Proof

## 3 EXAMPLE

Example	<p>Let <math>\alpha</math> be a basis of <math>\mathbb{V}</math> of <math>\mathbb{R}^{n \times n}</math> space and</p> <p>consider, <math>\alpha = \begin{pmatrix} 1 &amp; 7 &amp; -1 &amp; -1 \\ -1 &amp; 1 &amp; 2 &amp; 1 \\ 4 &amp; -2 &amp; 0 &amp; -4 \\ 2 &amp; 3 &amp; 4 &amp; -2 \end{pmatrix}</math></p> <p>linear transformation of <math>\alpha</math> into <math>\mathbb{V}</math>, <math>\mathbf{T}(\alpha) = c\alpha</math>, where <math>c</math> is a scalar, then row reduced echelon form of <math>\mathbf{T}</math> is</p> $rref(\mathbf{T}) = \begin{pmatrix} 1 & 0 & 0 & -1 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$ <p><math>\Rightarrow rank(\mathbf{T}) = 3,</math>  <math>nullity(\mathbf{T}) = 1</math></p> <p><math>\Rightarrow range(\mathbf{T}) = \begin{pmatrix} 1 &amp; 7 &amp; -1 \\ -1 &amp; 1 &amp; 2 \\ 4 &amp; -2 &amp; 0 \\ 2 &amp; 3 &amp; 4 \end{pmatrix},</math></p> <p><math>nullspace(\mathbf{T}) = \begin{pmatrix} 1 \\ 0 \\ 0 \\ 1 \end{pmatrix}</math></p> <p>Now linear transformation <math>\mathbf{T}(\mathbf{T}(\alpha)) = cda\alpha</math>, where <math>c</math> and <math>d</math> are scalars.</p> <p>Let <math>c = d = 1</math>, then <math>range(\mathbf{T}^2) = range(\mathbf{T})</math>,  <math>\Rightarrow rank(\mathbf{T}^2) = rank(\mathbf{T}) = 3,</math>  <math>\Rightarrow nullity(\mathbf{T}^2) = nullity(\mathbf{T}) = 1</math>  and <math>range(\mathbf{T}) \cap nullspace(\mathbf{T}) = \{0\}</math></p> <p>Hence proved that, the range and null space of <math>\mathbf{T}</math> are disjoint.</p>
