1 PROBLEM

(hoffman/page84/11) :

Let \mathbb{V} be a finite-dimensional vector space and let \mathbf{T} be a linear operator on \mathbb{V} . Suppose that $\text{rank}(\mathbf{T}^2) = \text{rank}(\mathbf{T})$. Prove that the range and null space of \mathbf{T} are disjoint, i.e., have only the zero vector in common.

2 SOLUTION

Given	\mathbb{V} is a finite-dimensional vector space, $\mathbf{T} : \mathbb{V} \rightarrow \mathbb{V}$ and $\text{rank}(\mathbf{T}^2) = \text{rank}(\mathbf{T})$
To Prove	range and null space of \mathbf{T} are disjoint
Defining $\text{rank}(\mathbf{T})$	<p>Let $\{\beta_1, \dots, \beta_k, \beta_{k+1}, \dots, \beta_n\}$ is the span of \mathbb{V}.</p> <p>The linear transformation of \mathbb{V} is $\{\mathbf{T}\beta_1, \dots, \mathbf{T}\beta_k, \mathbf{T}\beta_{k+1}, \dots, \mathbf{T}\beta_n\}$.</p> <p>Suppose the $\text{rank}(\mathbf{T}) = k$, then the basis of \mathbf{T} is $\{\mathbf{T}\beta_1, \dots, \mathbf{T}\beta_k\}$ and are linearly independent.</p>
Defining $\text{range}(\mathbf{T}^2)$	<p>Now $\mathbf{T}^2 : \mathbb{V} \rightarrow \mathbb{V}$ be a linear transformation for any $\alpha \in \mathbb{V}$. $\therefore \mathbf{T}^2(\mathbb{V}) = \mathbf{T}(\mathbf{T}(\alpha))$ and $\{\mathbf{T}^2\beta_1, \dots, \mathbf{T}^2\beta_k\}$ span the range of \mathbf{T}^2</p> <p>since $\text{rank}(\mathbf{T}^2) = \text{rank}(\mathbf{T})$ $\implies \dim \text{range}(\mathbf{T}^2) = \dim \text{range}(\mathbf{T})$ $\therefore \{\mathbf{T}^2\beta_1, \dots, \mathbf{T}^2\beta_k\}$ must be basis for $\text{range}(\mathbf{T}^2)$</p>

<p>Obtaining <i>range</i> and <i>nullspace</i> of \mathbf{T}</p>	<p>Now let $\alpha \in \text{range}(\mathbf{T})$, then it can be written as linear combinations of vectors in $\text{range}(\mathbf{T})$ $\therefore \alpha = C_1 \mathbf{T}\beta_1 + C_2 \mathbf{T}\beta_2 + \dots + C_k \mathbf{T}\beta_k$</p> <p>If $\alpha \in \text{nullspace}(\mathbf{T})$ also, then $\mathbf{T}(\mathbb{V}) = 0$ $\implies \mathbf{T}(C_1 \mathbf{T}\beta_1 + C_2 \mathbf{T}\beta_2 + \dots + C_k \mathbf{T}\beta_k) = 0$ $\implies C_1 \mathbf{T}^2\beta_1 + C_2 \mathbf{T}^2\beta_2 + \dots + C_k \mathbf{T}^2\beta_k = 0$</p> <p>since $\{\mathbf{T}^2\beta_1, \dots, \mathbf{T}^2\beta_k\}$ is basis of \mathbf{T}^2 $\implies C_1 = C_2 = \dots = C_k = 0$ $\implies \mathbb{V} = 0$ \therefore if α is in both $\text{range}(\mathbf{T})$ and $\text{nullspace}(\mathbf{T})$, then α must be a zero vector.</p> <p>Hence it is proved that range and null space of \mathbf{T} are disjoint.</p>
<p>Conclusion</p>	<p>The range and null space of \mathbf{T} are disjoint.</p>

TABLE 1: Proof

3 EXAMPLE

Example	<p>Let α is a $n \times n$ matrix $\in \mathbb{V}$ of \mathbb{R}^n space and</p> <p>consider, $\alpha = \begin{pmatrix} 1 & 7 & -1 & -1 \\ -1 & 1 & 2 & 1 \\ 4 & -2 & 0 & -4 \\ 2 & 3 & 4 & -2 \end{pmatrix}$</p> <p>linear transformation of α into \mathbb{V}, $\mathbf{T}(\alpha) = c\alpha$, where c is a scalar, then row reduced echelon form of \mathbf{T} is</p> $rref(\mathbf{T}) = \begin{pmatrix} 1 & 0 & 0 & -1 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$ <p>$\Rightarrow rank(\mathbf{T}) = 3,$ $nullity(\mathbf{T}) = 1$</p> <p>$\Rightarrow range(\mathbf{T}) = \begin{pmatrix} 1 & 7 & -1 \\ -1 & 1 & 2 \\ 4 & -2 & 0 \\ 2 & 3 & 4 \end{pmatrix},$</p> <p>$nullspace(\mathbf{T}) = \begin{pmatrix} 1 \\ 0 \\ 0 \\ 1 \end{pmatrix}$</p> <p>Now linear transformation $\mathbf{T}(\mathbf{T}(\alpha)) = cda\alpha$, where c and d are scalars.</p> <p>Let $c = d = 1$, then $range(\mathbf{T}^2) = range(\mathbf{T})$ and $rank(\mathbf{T}^2) = rank(\mathbf{T}) = 3,$ $nullity(\mathbf{T}^2) = nullity(\mathbf{T}) = 1$</p> <p>Hence proved that, the range and null space of \mathbf{T} are disjoint.</p>
